

The case for psychometrics

Alvin Tan, Stanford University
CogSci workshop, 2024-07-24

Outline

- Welcome + introduction
- A pitch for psychometrics
- A case study: Item and individual variability

Welcome!

differential item

models

drift diffusion
models

resource
competition

development

Introduction

This workshop

- Why is psychometrics important to cognitive science?
- How can psychological theories be built and tested as psychometric models?
- What are some good examples of psychometrics being used in cognitive science?

Resources

- Website: <https://psychometrics-workshop.github.io/>
- Pre-workshop tutorial on IRT

About you!

- Psychometricians
- Cognitive scientists who dabble in psychometrics
- Don't currently work with psychometrics but would like to learn more
- Anyone else...

Psychometrics: Who cares?

How do we measure stuff?

Cosmic microwave background radiation?

Personality?

Affect?

***Lack of direct
observational
access***

Memory?

Cognitive
ability?

The place for psychometrics

What are the sources of variance?

Is my measurement consistent?

How are latent constructs organised?

How much error is there?

What is psychometrics?

Validity

How do measurements relate to the underlying latent constructs?

Instrumentation

- Scaling
- Reliability
- Bias
- Measurement invariance
- Differential item functioning

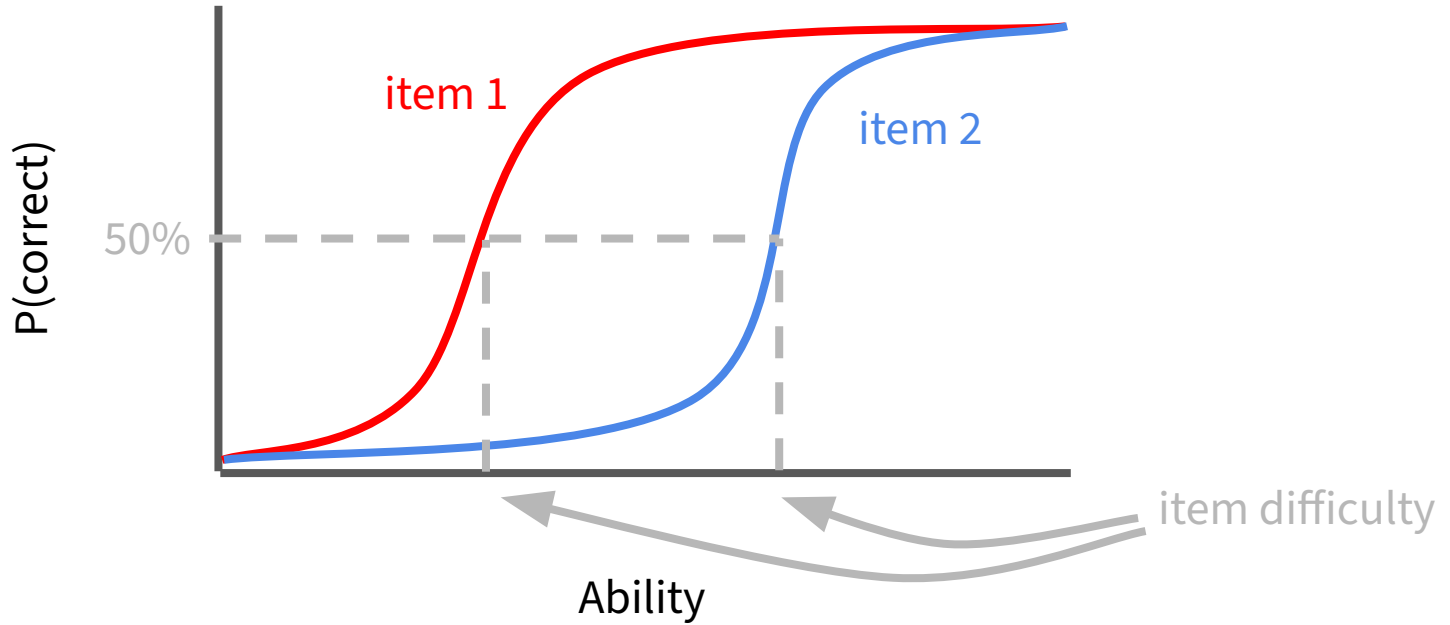

Measurement model

- Classical test theory
- **Item response theory**
- Generalisability theory

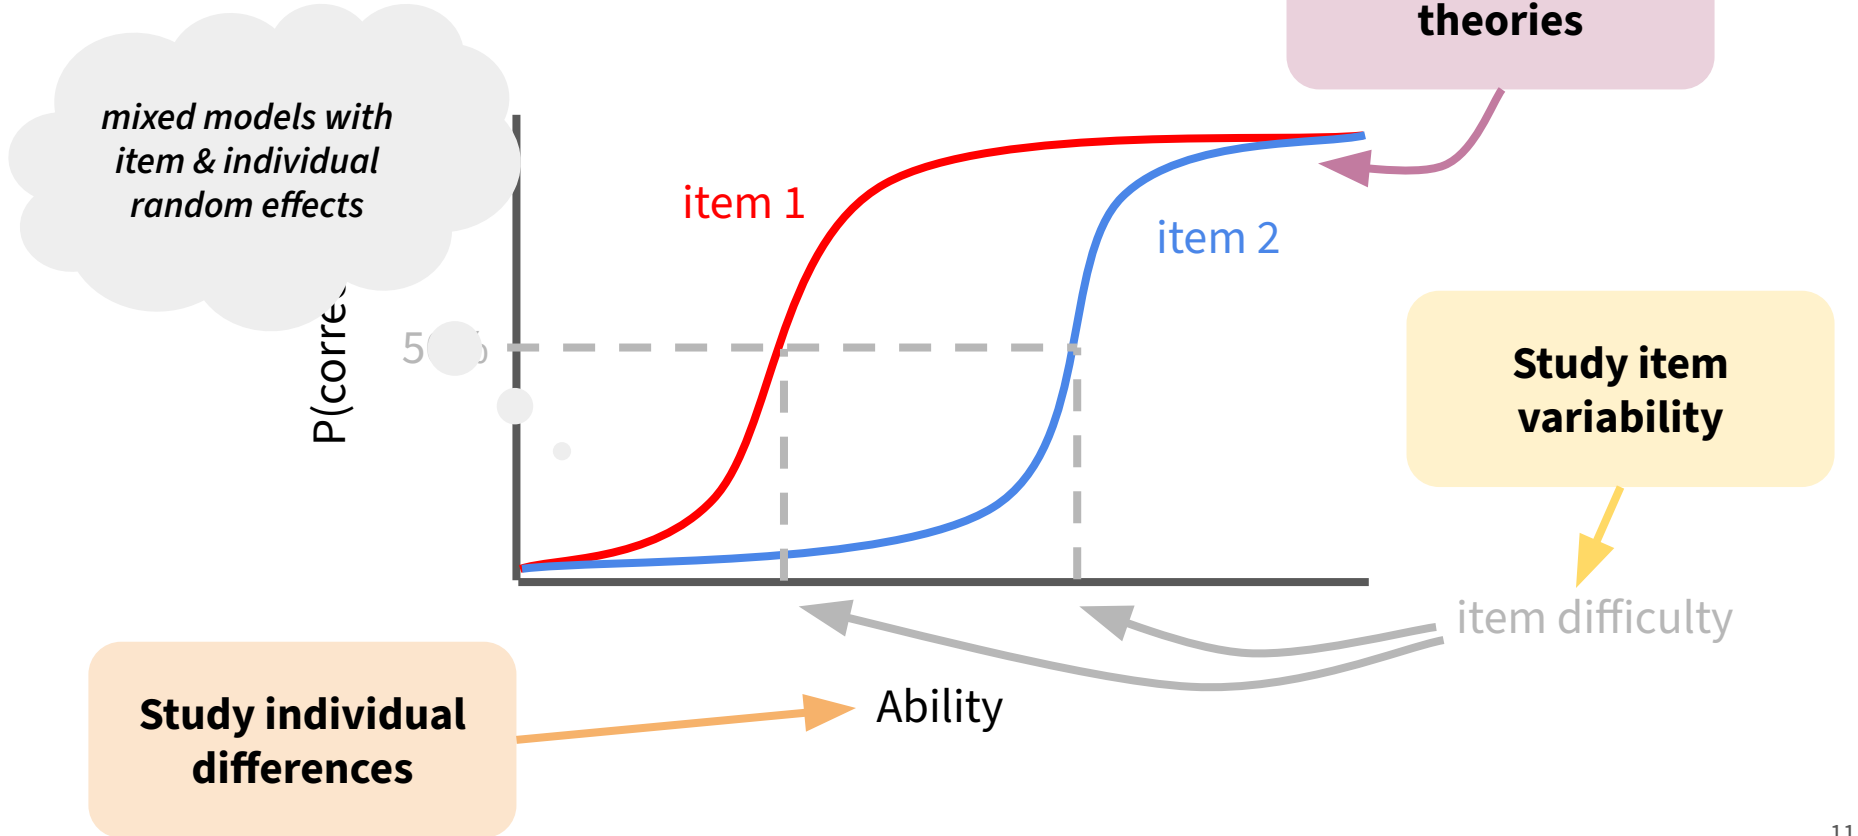

Latent structure

- Factor analysis
- Latent variable models
- Network theory
- Structural equation modelling

A psychometric approach

Wherefore psychometrics?

Studying item variability

Why?

- Understand dimensions of variability in the world
(e.g., Erhardt et al., [2023](#); García et al., [2023](#); Judd et al., [2024](#))
- Develop effective scales and tests
(e.g., Kachergis et al., [2022](#); McCowan & McCowan, [1999](#))
- Ensure item applicability
(e.g., Kubinger, [2008](#); Peterson et al., [2003](#); Shahsavar et al., [2023](#))

How?

- Explicit item-wise and inter-item analyses
(e.g., Piedmont, [2014](#); Rasch, [1993](#))
- Metrics for assessing scale/test properties
(e.g., Cooper, [2024](#); Kalkbrenner, [2021](#); Magis et al., [2010](#))

Studying individual variability

Why?

- Suggest mechanisms and developmental pathways
(e.g., Boogert et al., [2018](#); Fisher-Baum et al., [2018](#); Hofman et al., [2024](#); Oakes & Rakison, [2019](#); van der Maas et al., [2006](#))
- Understand natural variability → construct norms and diagnostics
(e.g., Frank et al., [2021](#); de Ron et al., [2019](#); Habibzadeh et al., [2016](#); Lenhard et al., [2019](#); Schaaf et al., [2023](#))

How?

- Better measurement of latent traits
(e.g., Cooper et al., [2017](#); Rouder & Haaf, [2019](#); Vermeent et al., [2024](#))

Constructing formal theories

Why?

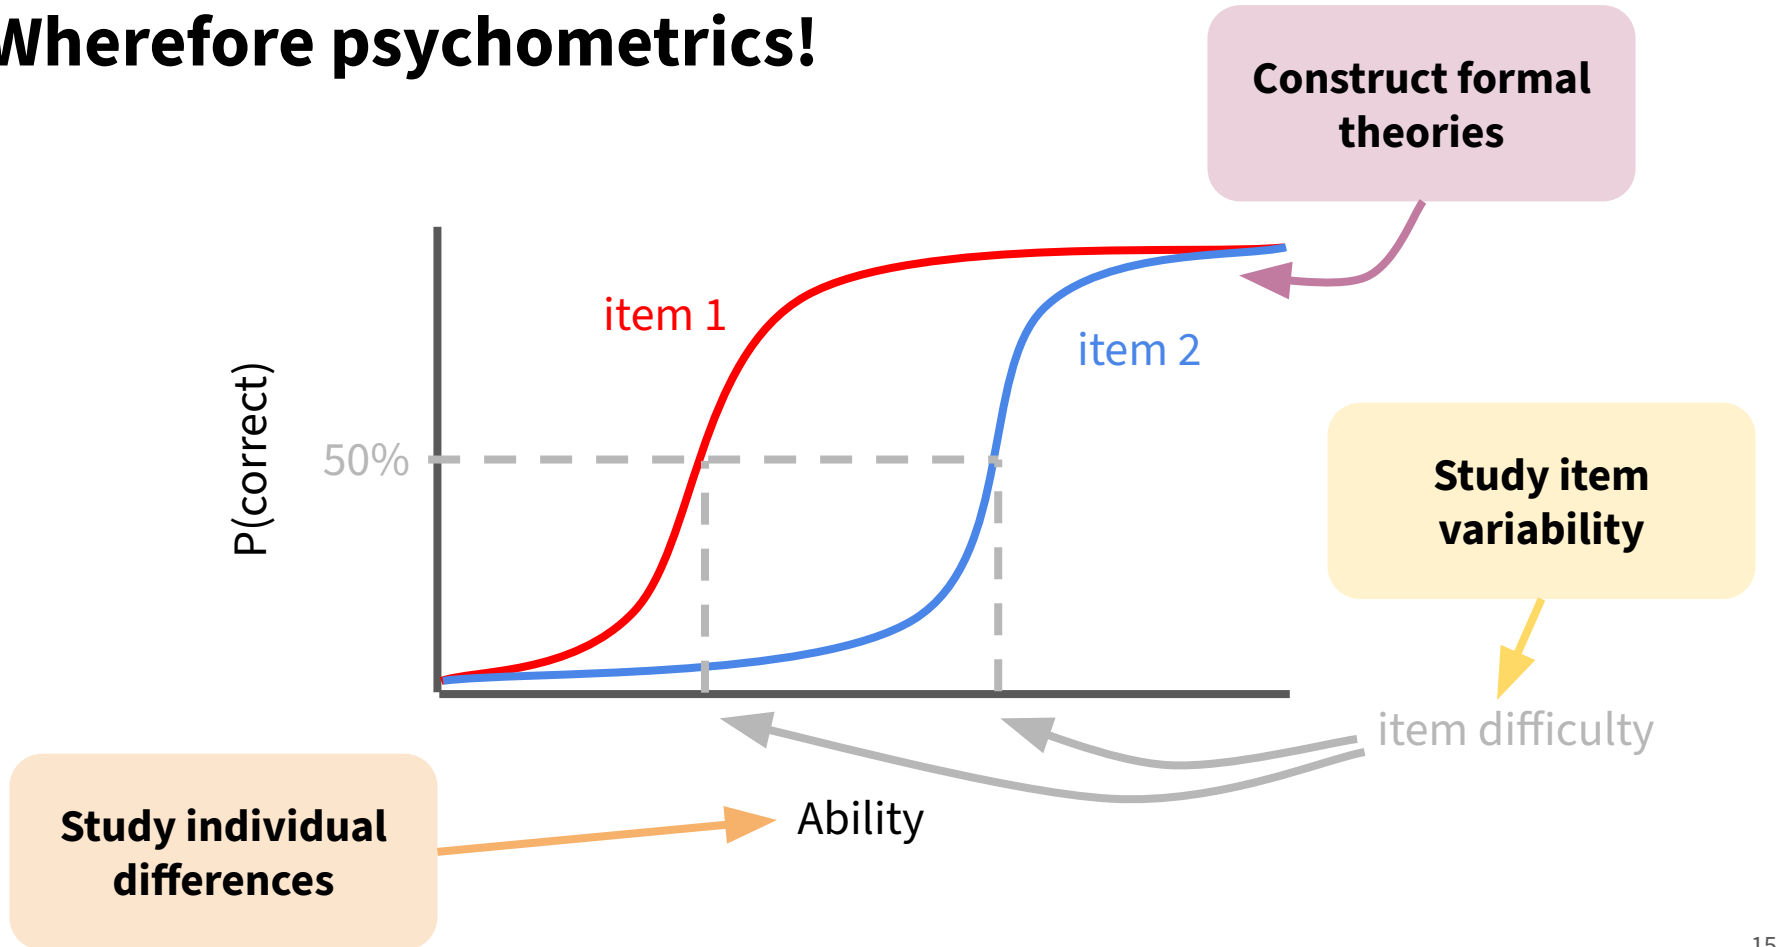

- Psychology lacks these!
(e.g., Muthukrishna & Henrich, [2019](#); Oberauer & Lewandowsky, [2019](#))
- Greater clarity, testability, and comparability
(e.g., Guest & Martin, [2021](#); Smaldino, [2020](#))
- Theory building
(e.g., Borsboom et al., [2021](#); Fried, [2021](#); Robinaugh et al., [2021](#))

How?

- Specification of measurement model
(e.g., Sijtsma & van der Ark, [2020](#); Wilson, [2013](#))
- Engagement with response processes and linking hypotheses
(e.g., Padilla & Benítez, [2018](#); van Grinsven, [2023](#); Yurovsky et al., [2012](#))

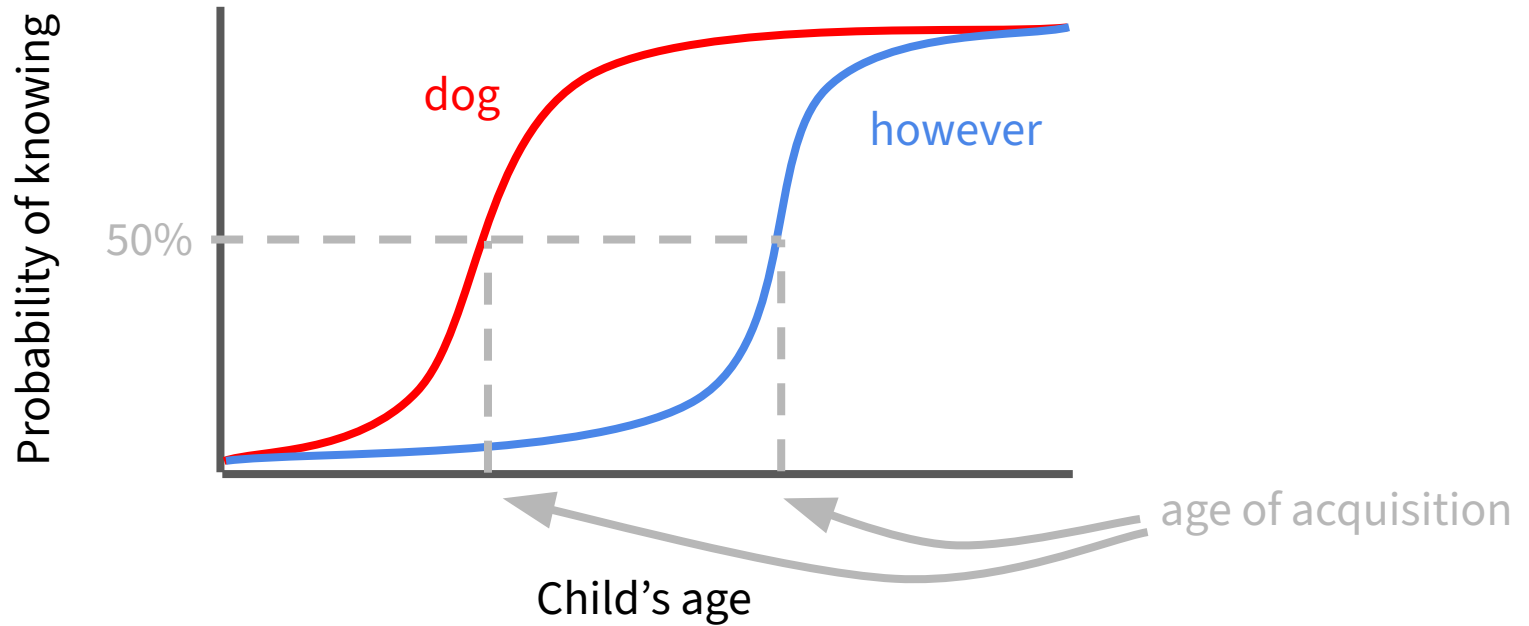

Wherefore psychometrics!

Case study: Item response theory in early vocabulary learning

Tan, Marchman, & Frank ([2024](#))

Early word learning

Communicative Development Inventories (CDIs)

1. SOUND EFFECTS AND ANIMAL SOUNDS (12)					
baa baa	<input type="checkbox"/>	meow	<input type="checkbox"/>	uh oh	<input type="checkbox"/>
choo choo	<input type="checkbox"/>	moo	<input type="checkbox"/>	vroom	<input type="checkbox"/>
cockadoodledoo	<input type="checkbox"/>	ouch	<input type="checkbox"/>	woof woof	<input type="checkbox"/>
grrr	<input type="checkbox"/>	quack quack	<input type="checkbox"/>	yum yum	<input type="checkbox"/>

2. ANIMALS (Real or Toy) (43)					
alligator	<input type="checkbox"/>	duck	<input type="checkbox"/>	penguin	<input type="checkbox"/>
animal	<input type="checkbox"/>	elephant	<input type="checkbox"/>	pig	<input type="checkbox"/>
ant	<input type="checkbox"/>	fish	<input type="checkbox"/>	pony	<input type="checkbox"/>
bear	<input type="checkbox"/>	frog	<input type="checkbox"/>	puppy	<input type="checkbox"/>
bee	<input type="checkbox"/>	giraffe	<input type="checkbox"/>	rooster	<input type="checkbox"/>
bird	<input type="checkbox"/>	goose	<input type="checkbox"/>	sheep	<input type="checkbox"/>
bug	<input type="checkbox"/>	hen	<input type="checkbox"/>	squirrel	<input type="checkbox"/>
bunny	<input type="checkbox"/>	horse	<input type="checkbox"/>	teddybear	<input type="checkbox"/>
butterfly	<input type="checkbox"/>	kitty	<input type="checkbox"/>	tiger	<input type="checkbox"/>
cat	<input type="checkbox"/>	lamb	<input type="checkbox"/>	turkey	<input type="checkbox"/>
chicken	<input type="checkbox"/>	lion	<input type="checkbox"/>	turtle	<input type="checkbox"/>
cow	<input type="checkbox"/>	monkey	<input type="checkbox"/>	wolf	<input type="checkbox"/>
deer	<input type="checkbox"/>	moose	<input type="checkbox"/>	zebra	<input type="checkbox"/>
dog	<input type="checkbox"/>	mouse	<input type="checkbox"/>		
donkey	<input type="checkbox"/>	owl	<input type="checkbox"/>

Method: Datasets

Languages	Contributor	<i>N</i>
English–Spanish	Virginia Marchman	147
English–Spanish	Erika Hoff	165
English–French	Diane Poulin-Dubois	59
English–French	Mitchell et al. (2022)	48

Analysis: The role of input

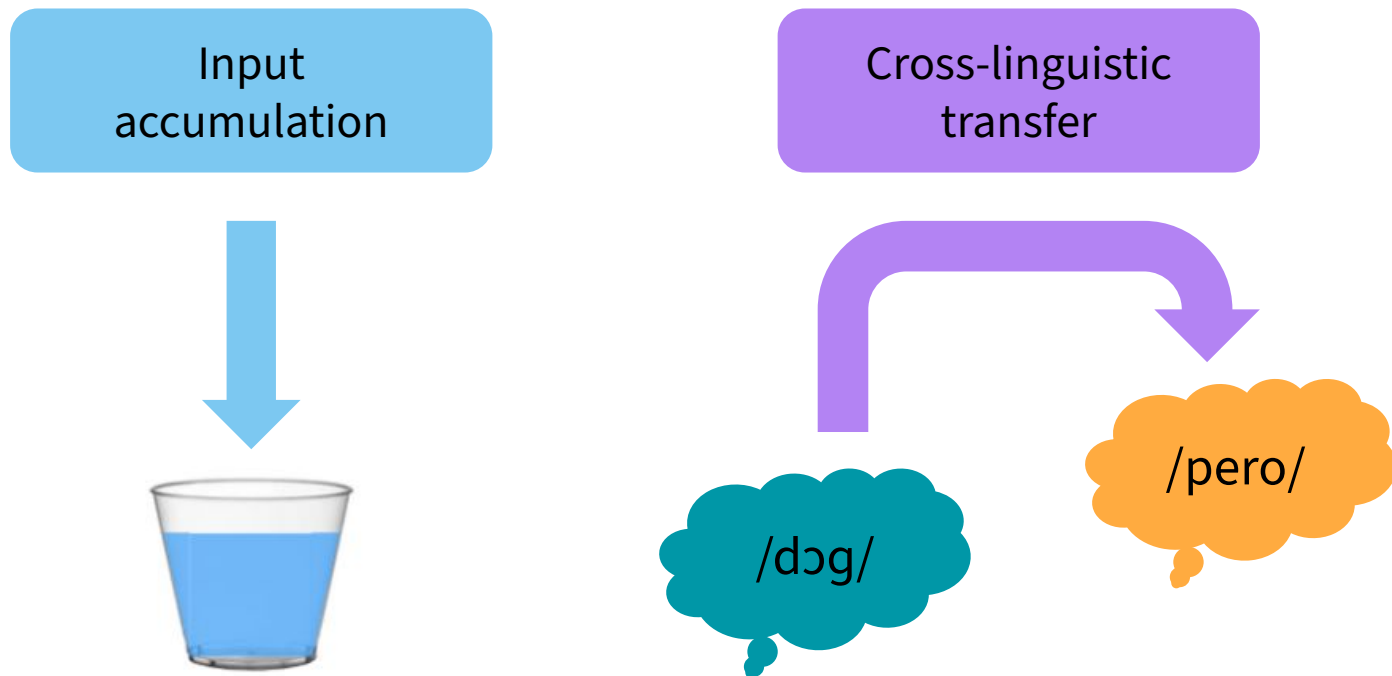

Analysis: Predictor effects

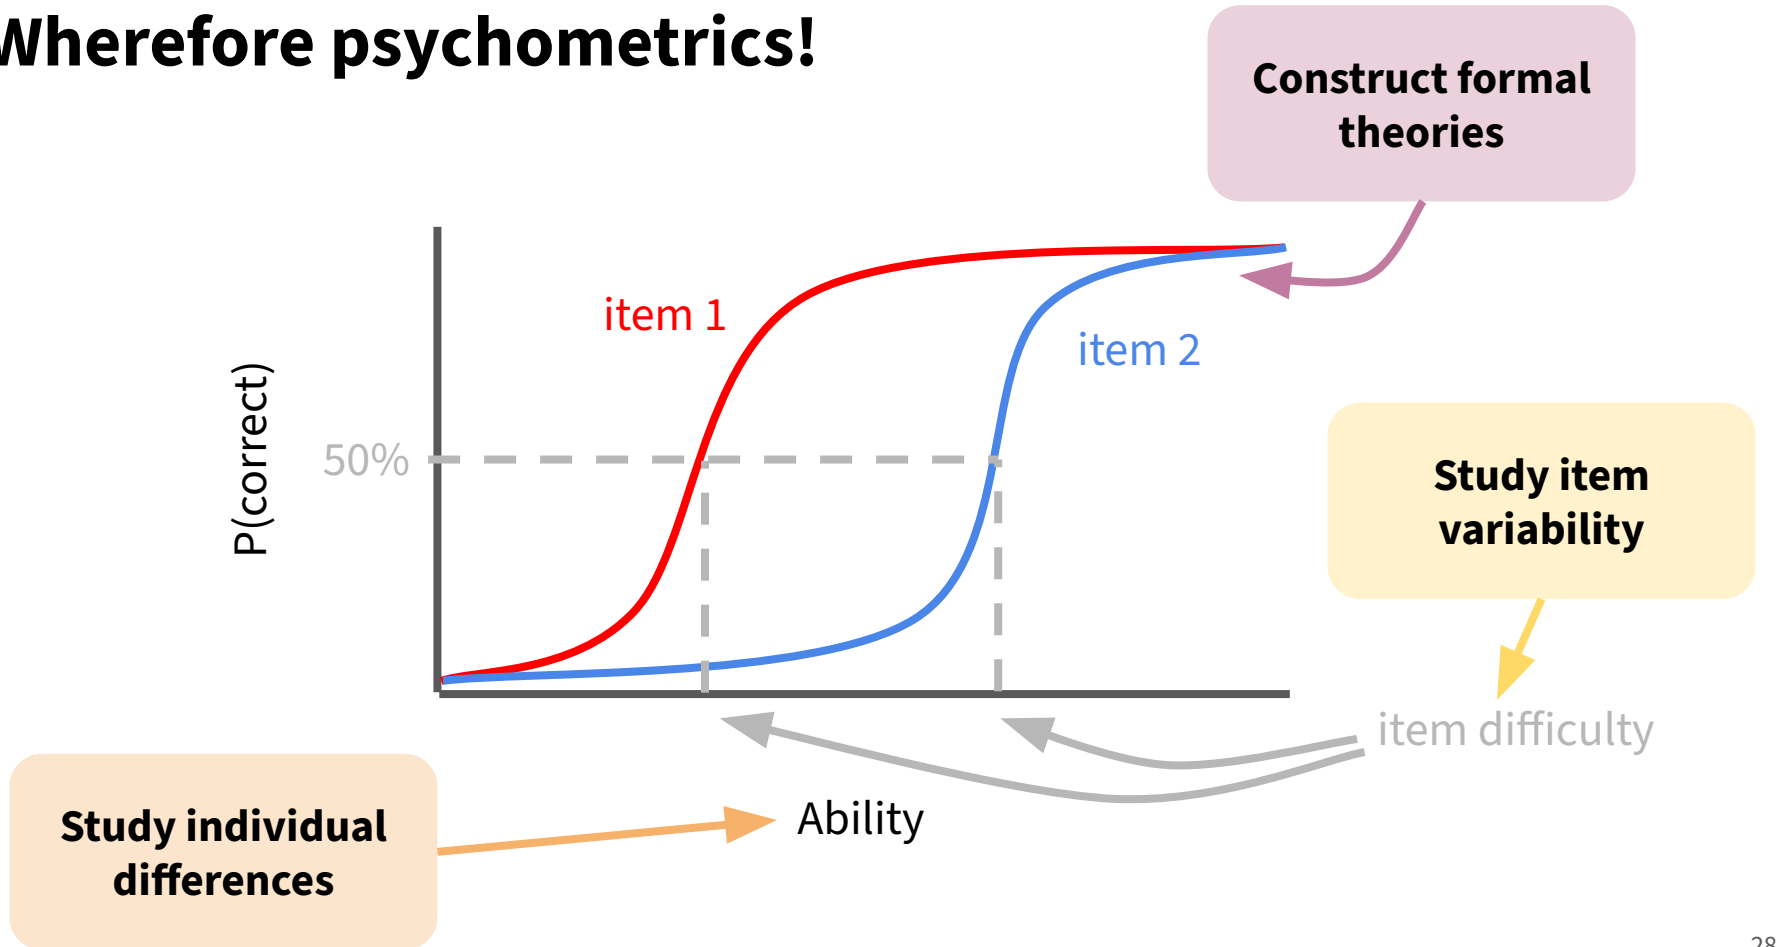

Discussion

- Bilingual children's word learning largely aligns with monolingual word learning
- Predictors are consistent across datasets and languages
- TE knowledge gives an advantage for younger children, for less frequent words, and for TE pairs that are more phonologically similar

Discussion: Two-route model

Wherefore psychometrics!

George Kachergis

Virginia Marchman

Michael C. Frank
